**Antibiotic  
Resistance**  
Partnership

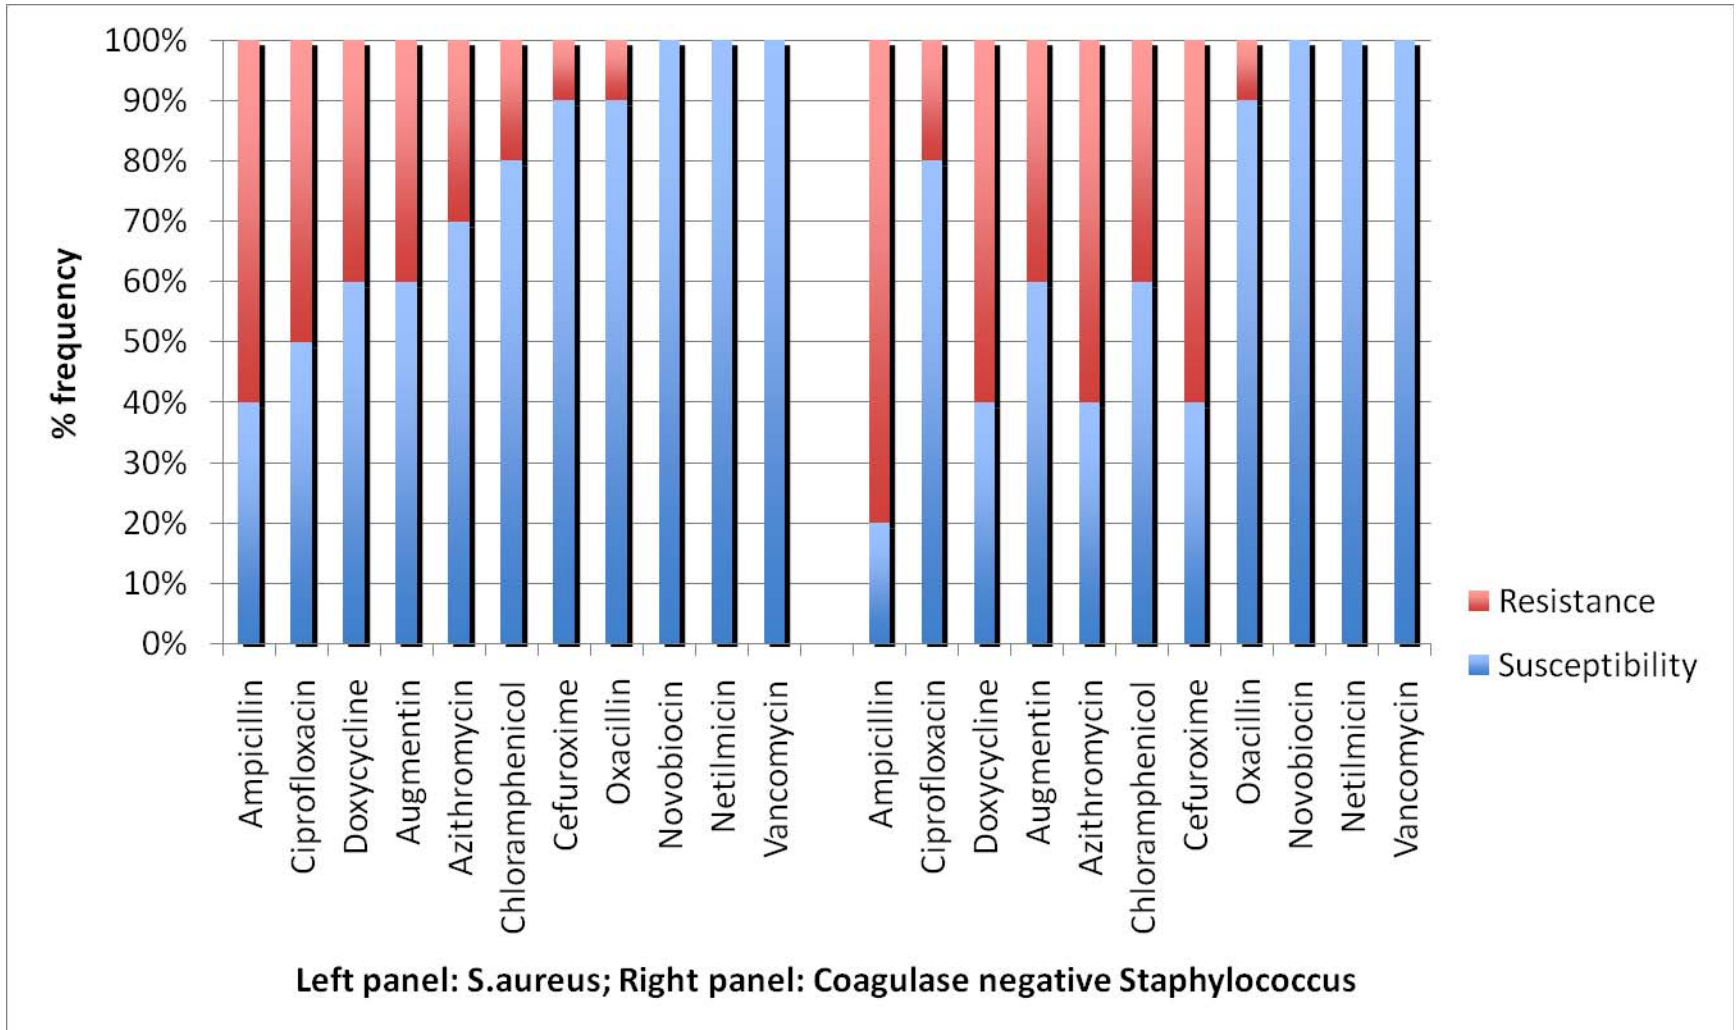

**CDDEP** THE CENTER FOR  
Disease Dynamics,  
Economics & Policy  
WASHINGTON DC • NEW DELHI

# Introduction

- **Although no systematic national surveillance is in place, few sentinel studies indicate that problem of antimicrobial resistance is an emerging public health problem**
- **Over-the-counter sales of pharmaceuticals still common in some retail chemists**
- **Use in animals restricted to commercial farming but in humans issue is critical**
- **Reliability of data: Quality assurance in susceptibility testing not widespread**  
e.g. - **Use of obsolete methods in AST, modified Stokes, poor quality disks, etc**

# **Data from sentinel surveillance on antimicrobial resistance in health facilities**

# Antibiotic susceptibility for *Staphylococcus aureus* isolated from wound sepsis

# Antimicrobial susceptibility of *E. coli* from adults with diarrhoea at Mbagathi District Hospital (MDH) (N=264)

# Prevalence of resistant *E. coli* strains isolated from PLWHA

## *E. coli* from UTIs

Courtesy: Aga Khan University Hospital

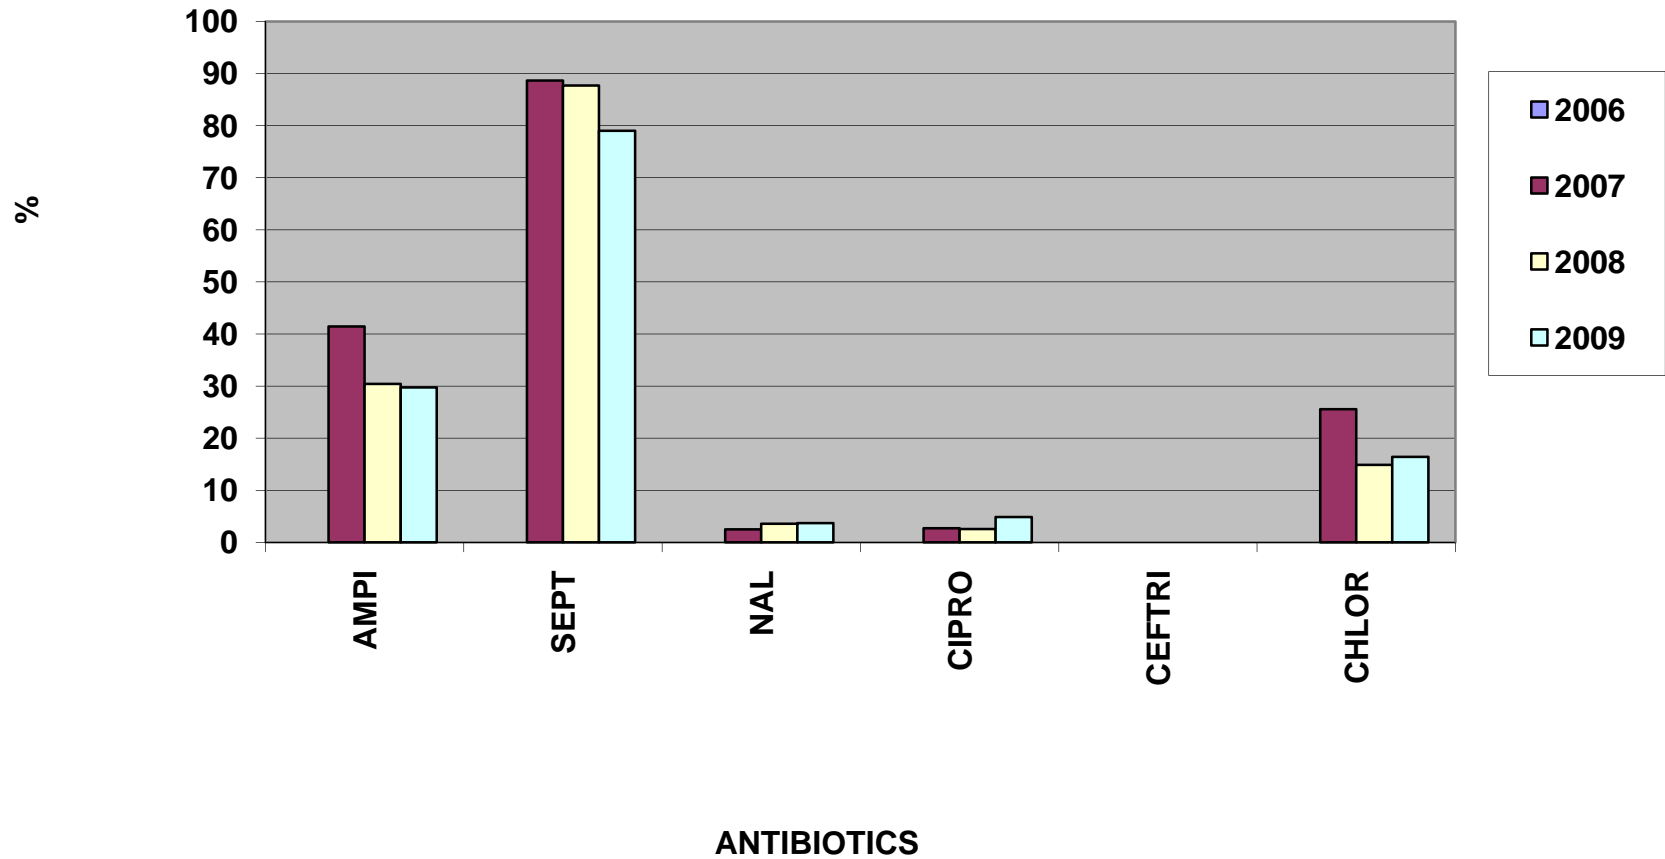

# *E. coli* from children with diarrhoea

*Minimum inhibitory concentrations (MIC) of each of 10 antimicrobial agents for the E.coli isolates from children*

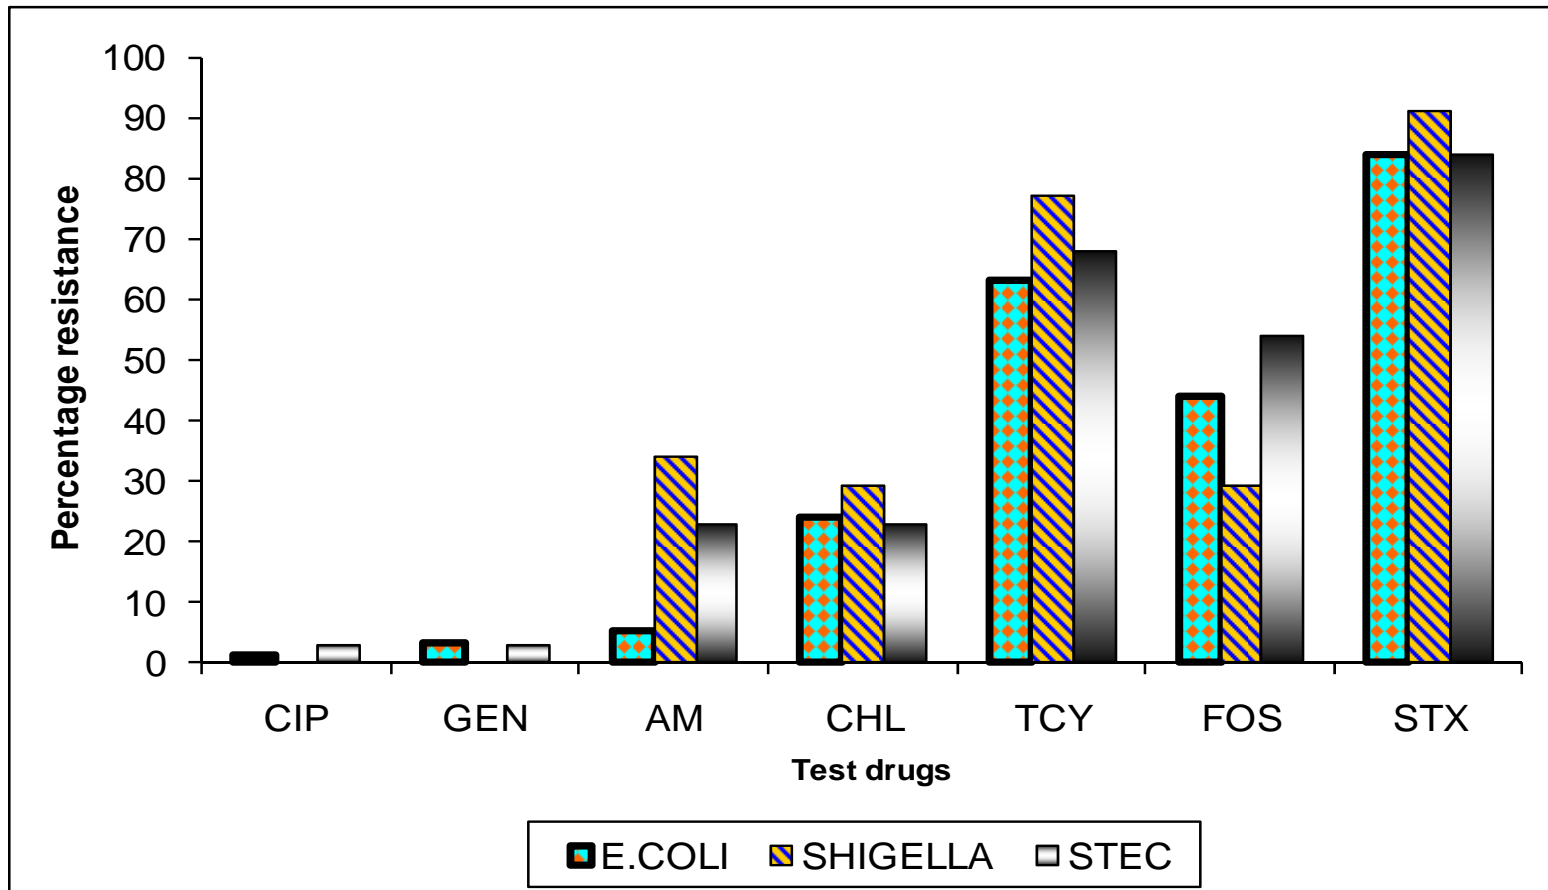

Agent	Range	MIC (ug/ml)		Resistance	
		Mode	MIC <sub>50</sub>	MIC <sub>90</sub>	(%of isolates)
<b>ISOLATES FROM CHILDREN (N=168)</b>					
Amoxicillin	1-128	128	128	128	74
Augmentin	0.5-64	8	8	32	22
Ceftazidime	0.06-16	0.25	0.25	1	0
Cefuroxime	2-64	8	8	16	42
Chloramphenicol	0.5-64	8	8	64	40
Ciprofloxacin	0.004-1	0.015	0.015	0.03	0
C0-trimoxazole	0.02-64	6.4	2.56	6.4	63
Gentamicin	0.25-32	0.5	1	8	27
Nalidixic acid	1-64	4	4	8	2
Tetracycline	1-128	128	64	128	71

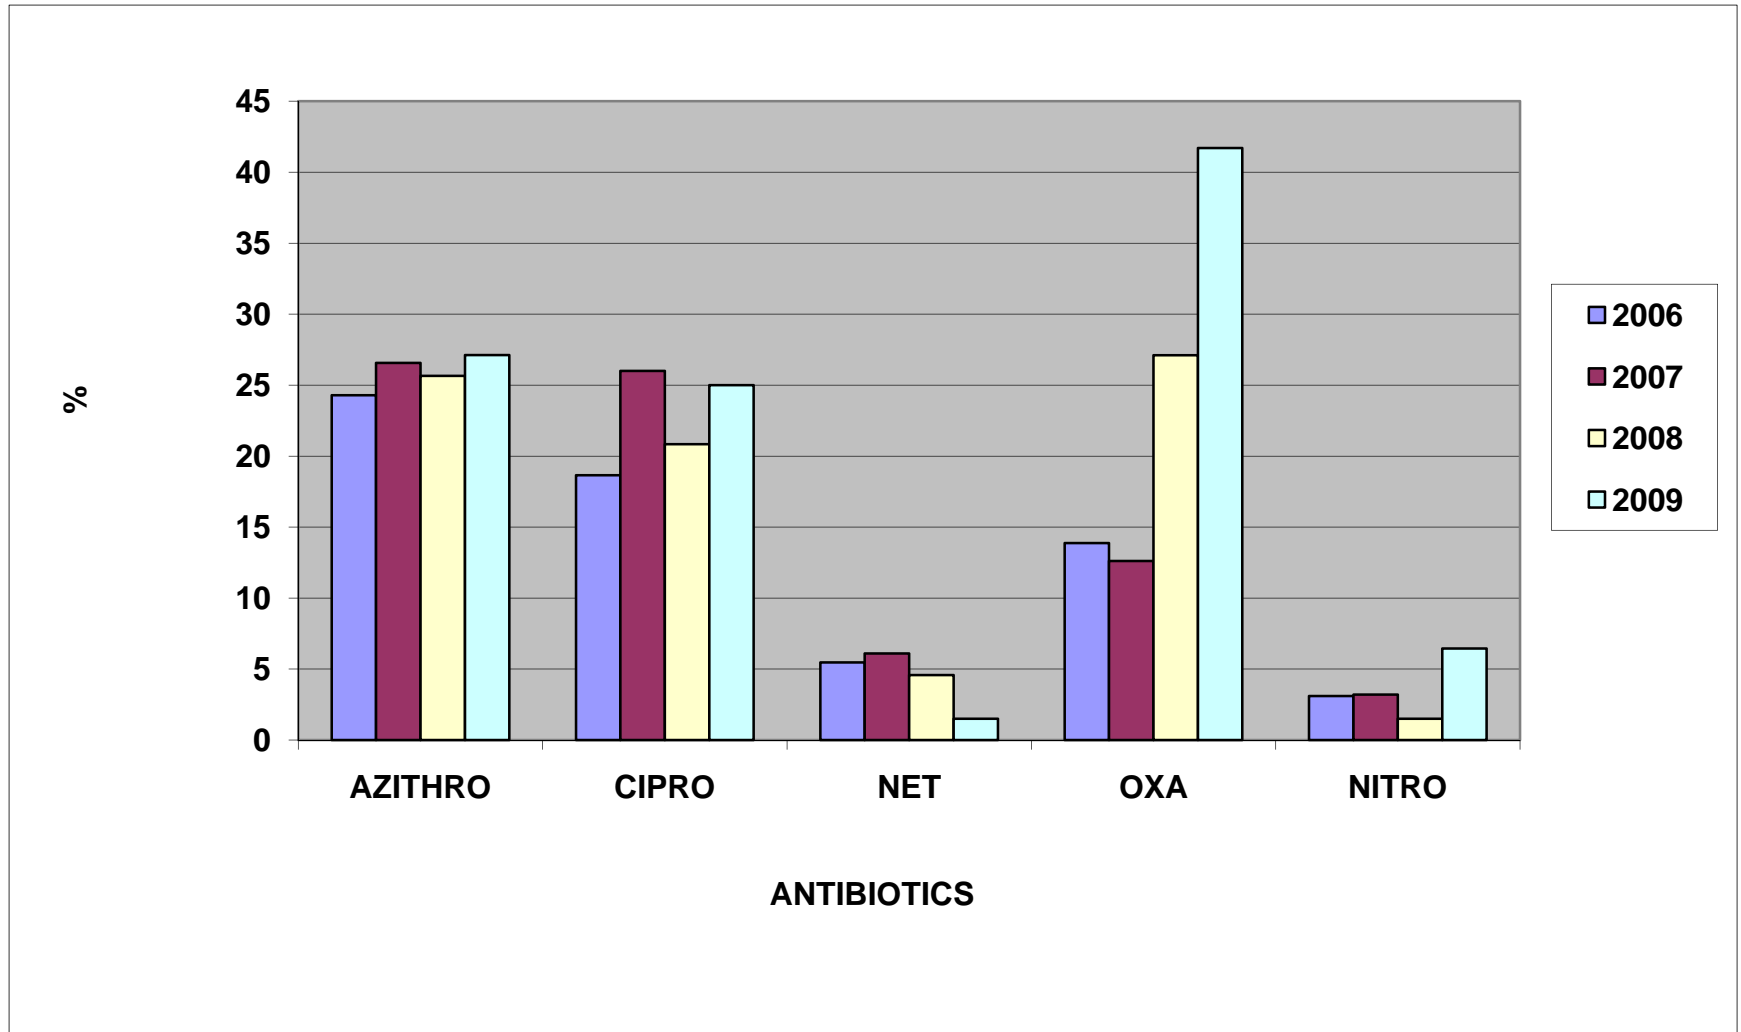

# Shigella spp n=112

# Antibiotic resistance patterns of E. coli, Shigella and STEC to various test drugs; 2006-2007

# *Staphylococcus aureus*, n=282

# Invasive non-typhoidal Salmonella (NTS) 1994-1996

<b>Antibiotic</b>	<b>MIC range</b>	<b>Mode</b>	<b>MIC90</b>	<b>%R</b>

# 10-yr Trend in resistance – Rural Kilifi

Trends in resistance during the 12-year study. Chi-squared and p-values, respectively, for trend by year analysis for resistance were chloramphenicol ( $\chi^2= 3.794$ ;  $p=0.051$ ), gentamicin ( $\chi^2= 7.958$ ;  $p=0.005$ ), co-trimoxazole ( $\chi^2= 16.358$ ;  $p< 0.001$ ) and amoxycillin ( $\chi^2= 20.977$ ;  $p< 0.001$ ).

# Challenges

- Funding issues versus Government priorities in Public Health a challenge
- Materials e.g. media, antibiotic discs, petri dishes etc inadequate
- Equipment such as autoclaves, incubators and microscopes inadequate
- Collection of specimens not well supervised
- Several labs still require training support for their staff in order to undertake quality AST and surveillance.
- National/Regional surveillance still not fully achieved

# Achievements

- **Participation in EQAS through WHO/CDC programme annually.**
- **KEMRI, AMREF, UoN, Kenyatta National Hospital**
- **Kilifi WT, Gertrudes Children's Hospital**
- **Aga Khan Hospital in Nairobi and Mombasa**
- **Internal QA for each laboratory has been set up – all use CLSI recommended standards for AST including using ATCC QC strains.**
- **GSS Regional Training has helped to create awareness, regular informal consultation between the laboratories has been ongoing.**

# Conclusion

- **More sentinel sites need to be facilitated to start surveillance.**
- **Partnerships between these sites and WHO/CDC will be crucial in providing training and co-funding activities**
- **Strengthen local training initiatives by expanding GSS and ASM activities in the region.**
- **Curriculum reviews at medical schools in Kenya to include emphasis on surveillance and monitoring usage and resistance**
- **Expanding EQAS and internal QA programs and reviews will play a big role**
